TLS MANAGEMENT: COMMON VS UNCOMMON

How to go from manual TLS management to the industry's best practice.

COMMON

Using spreadsheets to track certificate locations, owners, cipher suites and TLS versions

Manually identifying and removing weak keys, cipher suites and hashes

Not being aware of network or system changes

Relying on email to remember to renew certificates

UNCOMMON

A single platform that—

Manages users and certificates

Identifies weak keys, cipher suites and hashes

Makes certificate issuance instantaneous and automatically renews certificates

Sends you notifications of any systems changes

Grades the health of each certificate

Learn how DigiCert® CertCentral can help you take an uncompromising approach to certificate management.
